Leafgro

The practice of removing organic debris from our lawns and gardens has disrupted the natural pattern of returning vital plant matter to the soil. Prior to this practice, the fertility of the soil was maintained by the decay of plant matter. By incorporating Leafgro[®] organic compost into landscape areas, we are following nature's method of building soil fertility. It has been said that utilizing compost is a link between modern agricultural practices and nature's own method.

Professional landscapers, as well as individual homeowners, are becoming aware of how important it is to give back to the soil instead of constantly taking away. By incorporating Leafgro[®] into landscape areas, you will replenish the organic portion of the soil and thus create a more productive topsoil. When Leafgro[®] is mixed with sandy soils, the moisture and nutrient holding capacity of the soil will be increased. When mixed with heavy clay soils, Leafgro[®] will loosen the soil by separating the clay particles, allowing oxygen and moisture to move more freely. The improved aeration will encourage healthy root development and plant growth.

Leafgro[®] has been proven to be an excellent soil conditioner by landscapers, contractors, nurserymen, and homeowners. For more information about Leafgro[®], or for a list of retail dealers, call Maryland Environmental Service at (301) 261-8596 or (410) 974-7268.
